Hiring Manager
LVT

Re: Technical Program Manager - Hardware

Hardware programs rarely slip because of one big failure. They slip because firmware, packaging, and the factory each make a reasonable call that nobody else saw coming. Keeping those calls visible is the job I've been doing.

At Lion Energy I ran the PPG2500 portable power station from development into production and took two more products through prototype. The work was full of tradeoffs between weight, battery configuration, component placement, and cost, and my role was getting electrical, mechanical, firmware, and our manufacturers in China and Vietnam to decide together. I set up Scrum, Jira, and Confluence so leaders could see blockers without chasing people for updates. Before that, at Aptive, I owned software used by more than 2,000 reps and coordinated about 12 developers across shared and overseas teams.

But the part of this role that stands out is the field. LVT's units are solar powered and deployed in the real world, which is exactly where my returns work at Lion lived. I cut root cause investigations from months to about a week by getting field data back to engineering fast. I'd like to show you how I'd run feature programs across your deployed and next generation models. Could we talk next week?

Sincerely,

Eric Howes
